

DATA 2 SCOPE SHEET

1. **The community user. *Who exactly is this for? Name the group, and where they are. "The community" is not specific enough.***

Local farmers in Ghana who produce foodstuff like plantain, yam, cassava and maize

2. **The problem, as it happens today. *What do they currently do, and what goes wrong? Two or three sentences.***

Farmers do not have an easy way to compare commodity prices across different markets and periods. So this makes it difficult to identify price changes, compare market prices to make informed buying/selling decisions.

3. **What we are building: *One sentence describing the product, then what changes for the user once it exists.***

Building an interactive market prices dashboard that allows farmers to explore and compare commodity prices across markets and over time. Helping them make more informed market decisions.

4. **Core feature — working end to end by Friday 11 September (Gate 2). *The single most important thing your product does. Just one.***

A price dashboard that allows farmers to select a commodity and compare its prices across different markets and time periods to support better selling decisions.

5. **Explicitly out of scope. *What you have decided NOT to build. Teams that skip this always overrun.***

Price forecasting

Real-time price updates and

Offline mobile app

6. **Who owns what? *Every person needs something specific. Fill the right-hand column together.***

Name	Track	Role	What they own
Elvis Frimpong	Data / Analytics	Team Lead	Project Coordination & Dashboard development
Emmanuel Quarshie	Data / Analytics	Foundation	Presentation & Documentation
Ferdinard Aful Bentum	Data / Analytics	Foundations	Research & KPI Analysis
Fuseini Sulleyman	Data / Analytics	Builder	Dashboard Development
Leon Kimene Ibovi	Data / Analytics	Foundations	Data Cleaning & Validation

7. Offline-first check

Question	Your answer
Does the product work with no or poor internet?	Yes, partially. The dashboard can be accessed locally in Power BI Desktop without an internet connection.
Which parts need a connection, and what happens without one?	Refreshing online data require internet. Without a connection, users can still view the locally saved dashboard and existing data
Any heavy dependency (large downloads, paid API, cloud-only service)?	No dependency. We are using a downloaded dataset and Power BI hence no paid API is required.
If connectivity fails during the Week 5 demo, how will you still show it?	We will keep an offline Power BI Desktop version and screenshots/PDF of the dashboard as backup for the demonstration.
